

Habib Ahmed has gathered together an impressive array of studies and texts on the related concepts of time, space and motion and their articulation in the Islamic tradition. Contributions from leading scholars in the history of Islamic science, philosophy and mysticism are complemented by important translations of medieval Arabic and Persian treatments. This volume is a veritable goldmine for anyone interested in the study of cosmology and the related fields of epistemology and spirituality.

David C. Reisman,
Assistant Professor
University of Illinois at Chicago

Time, Space and Motion in Islam is a unique and unusual book. It is a pioneering work in a much-neglected field, appropriately brought out in this historic time when space and motion have acquired a new objective reality and subjective dimension. The volume contains a wide array of ideas from classical literature to modern thought, from philosophical concepts to scientific concepts etc. It deals with Sufi subjectivity, scientific objectivity, and philosophical introspections. The work brings classical Islamic tradition in dialogue with our own time and provides a new (historical and modern) context to discoveries, ideas and experiments.
